

ABSTRACT OF THE DISCLOSURE

In the incoming call blocking system, a mobile terminal sends position information from a GPS receiving section to a switchboard through a plurality of base stations, the switchboard stores the received position information of the mobile terminal into an area of the mobile terminal in a movement monitoring memory, calculates by comparing the previous position information and the present position information for a difference to determine a moving speed of the mobile terminal, and judges whether the mobile terminal is moving at a high speed to block incoming calls.
